

Angstrom Data Science Task

March 2022

1 Introduction

We would like you to demonstrate some of your Data Science skills by completing the following task. The task is designed to be fairly open ended and there are no right or wrong answers, its more about demonstrating your skills and mindset when it comes to extracting insight from data.

2 Task

Along with this document you should have received a dataset in csv format. The data represents box scores from NCAA college basketball games over a 1.5 season period. We would like you to build a model that predicts the winners for the round of matches on the 22nd January 2022. How you go about this is entirely down to you. What matters is your ability to demonstrate, explain and justify your approach. Whether this be via presentation or notebook or some other format this is also up to you. There are no restrictions on language either. Just make sure to submit whatever you have produced 4hrs after you receive it!
